phylogenetics often uncovers contradicting hypotheses regarding the relationships within the same group of organisms a phenomenon known since the beginning of the molecular systematics era while historically single marker based analyses produced discordance nowadays entire cellular genomes or portions of the same genomic compartment conflict with others or the rest respectively in contrast to the beginning of the molecular systematics era when adding markers and taxa offered a way out of systematic errors genome inference based incongruences cannot be addressed and explained easily disagreeing phylogenomic hypotheses might originate from various evolutionary processes including but not limited to hybridization or incomplete lineage sorting thereby leading to gene tree versus species tree associated discrepancies today this can be expanded to genome discordance where phylogenomic signals of organellar genomes plastid mitochondrial and the nuclear genome disagree due to intrinsically different coalescent paths or phenomena like organelle capture

genetic diversity is the key to crop improvement and food security there are more than 1500 gene banks around the world and genetic resources are maintained in nature reserves and on farms genetic diversity serves as the starting point for breeding crops with improved nutritional quality higher yields and better tolerance to abiotic and biotic stresses however genetic diversity also provides opportunities for diversifying farm and food systems utilization depends on access to material and information however

many gene banks experience backlogs in characterization evaluation regeneration viability tests plant health monitoring and information sharing this research topic focuses on advances in plant genetic resource conservation and utilization
